

ABSTRACT

A single lens element used for converting a divergent pencil of rays, radiated from a light source, into a predetermined
5 convergent state, wherein

the single lens element is made from a resin and has a positive optical power due to a refraction effect and a positive optical power due to a diffraction effect,

the diffraction effect is based on a diffraction structure
10 formed on at least one of an incident side surface and an exit side surface of the single lens element, and

the following expressions are satisfied:

$$0.1 < NA < 0.3$$

$$0.4 < T/f < 0.75$$

15
$$2.2 < f_r/f < 3$$

here,

f is a focal length of the entire single lens element,

f_r is a focal length due to the refraction effect of the single lens element,

20 T is a thickness of the single lens element on an optical axis, and

NA is a numerical aperture of a single lens element at an incident side.
